# Weapon Detection using Artificial Intelligence and Deep Learning for Security Applications

Harsh Jain, Aditya Vikram, Mohana, Ankit Kashyap, Ayush Jain  
 Telecommunication Engineering, RV College of Engineering®  
 Bengaluru, Karnataka, India.

**Abstract-** Security is always a main concern in every domain, due to a rise in crime rate in a crowded event or suspicious lonely areas. Abnormal detection and monitoring have major applications of computer vision to tackle various problems. Due to growing demand in the protection of safety, security and personal properties, needs and deployment of video surveillance systems can recognize and interpret the scene and anomaly events play a vital role in intelligence monitoring. This paper implements automatic gun (or) weapon detection using a convolution neural network (CNN) based SSD and Faster RCNN algorithms. Proposed implementation uses two types of datasets. One dataset, which had pre-labelled images and the other one is a set of images, which were labelled manually. Results are tabulated, both algorithms achieve good accuracy, but their application in real situations can be based on the trade-off between speed and accuracy.

**Keywords—** Computer vision, weapon detection, Faster RCNN, SSD, CCTV, Artificial Intelligence (AI).

## I. INTRODUCTION

Weapon or Anomaly detection is the identification of irregular, unexpected, unpredictable, unusual events or items, which is not considered as a normally occurring event or a regular item in a pattern or items present in a dataset and thus different from existing patterns. An anomaly is a pattern that occurs differently from a set of standard patterns. Therefore, anomalies depend on the phenomenon of interest [3] [4]. Object detection uses feature extraction and learning algorithms or models to recognize instances of various category of objects [6]. Proposed implementation focuses on accurate gun detection and classification. Also concerned with accuracy, since a false alarm could result in adverse responses [11] [12]. Choosing the right approach required to make a proper trade-off between accuracy and speed. Figure 1 shows the methodology of weapons detection using deep learning. Frames are extracted from the input video. Frame differencing algorithm is applied and bounding box created before the detection of object [7] [8] [14].

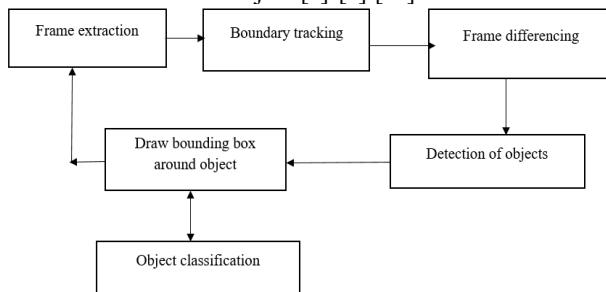

Fig.1.Methodology

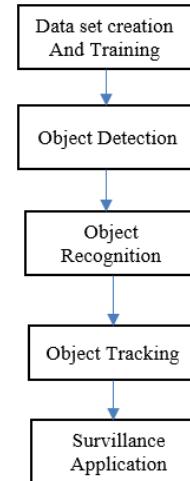

Fig.2. Detection and Tracking

The flow of object detection and tracking as shown in figure 2. Dataset is created, trained and fed to object detection algorithm. Based on application suitable detection algorithm (SSD or fast RCNN) chosen for gun detection. The approach addresses a problem of detection using various machine-learning models like Region Convolutional Neural Network (RCNN), Single Shot Detection (SSD) [2][9][15].

## II. IMPLEMENTATION

### A. Resources or components used for implementation

- *OpenCV 3.4*- Open source computer vision library version 3.4.
- *Python 3.5*- High level programming language used for various image-processing applications.
- *COCO Dataset*- Dataset consisting of common objects with respective labels.
- *Anaconda and Tensorflow 1.1*
- *NVIDIA GeForce 820M GPU*-GeForce is a brand of graphics processing units designed by Nvidia.

### B. Dataset Specifications

#### Case – I: Video specifications

- System Configuration- Intel i5 7<sup>th</sup> Generation (4 Cores)
- Clock Speed- 2.5 GHz
- GPU- NVIDIA GeForce 820M
- Input Frames per Second- 29.97 fps
- Output Frames per Second- 0.20 fps
- Video Format- .mov
- Video Size- 4.14 MB
- COCO and self-created image dataset

- Number of classes trained- 5

#### Case – II: Image specifications

- System Configuration- Intel i5 7th Generation (4 Cores)
- Clock Speed- 2.5 GHz
- GPU- NVIDIA GeForce 820M
- Input Image Size- 200-300 KB
- Training Time- ~0.6 seconds(SSD)  
 ~1.7 seconds(RCNN)
- Image Format - .JPG
- COCO and self-created image dataset
- Number of classes trained for- 5

#### C. Assumptions and Constraints made for implementation

- The gun is in line of sight of camera and fully/partially exposed to the camera.
- There is enough background light to detect the ammunition.
- GPU with high-end computation power were used to remove lag in the ammunition detection.
- This is not a completely automated system. Every gun detection warning will be verified by a person in charge.

#### D. FASTER R-CNN

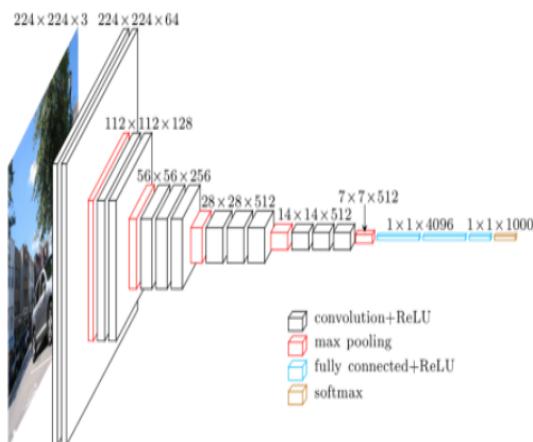

Fig 3. Layers in CNN Architecture [5]

Layers of CNN and faster RCNN architecture depicted in figure 3 and 4 respectively. It has two networks RPN to generate region proposals and network for object detection. To generate region proposals it uses selective search approach. Anchors or region boxes are ranked by RPN network.

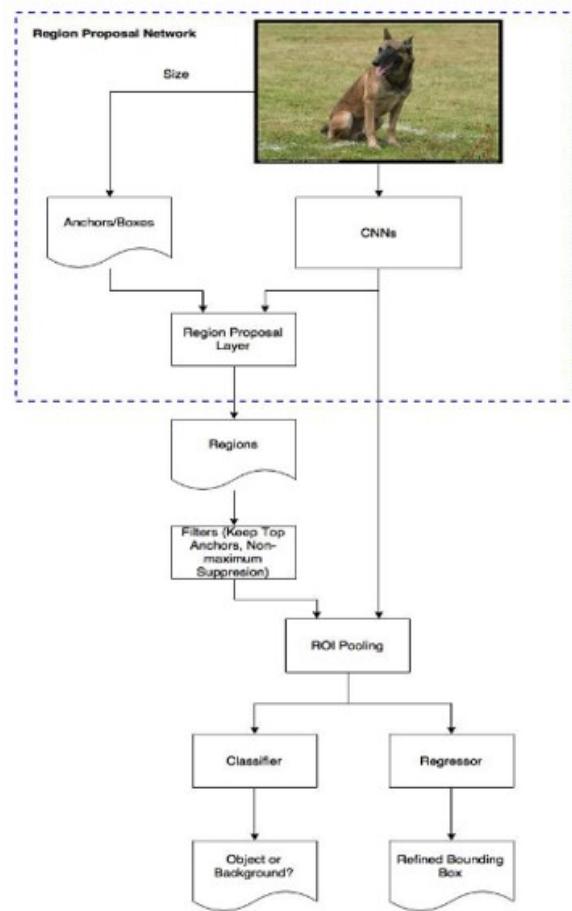

Fig 4. Faster R-CNN [5]

#### Dataset Creation and Training

Images are downloaded in bulk using Fatkun Batch Image Downloader (chrome extension) which can download multiple Google Images at once. Then the downloaded images are labelled. 80% of total images used for training and 20% images for testing. The created ammunition dataset was then trained using Single Shot Detector (SSD) model and made 2669 iterations/steps on the model to ensure that the loss is less than 0.05 in order to increase the accuracy and precision. Figure 5 shows folder with test and train images. Figure 6 shows image with labels.

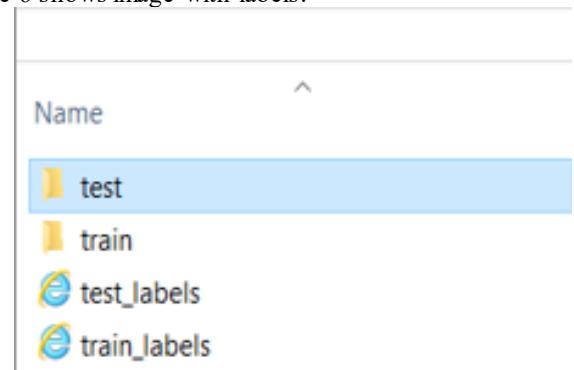

Fig.5. Folder with test and train images

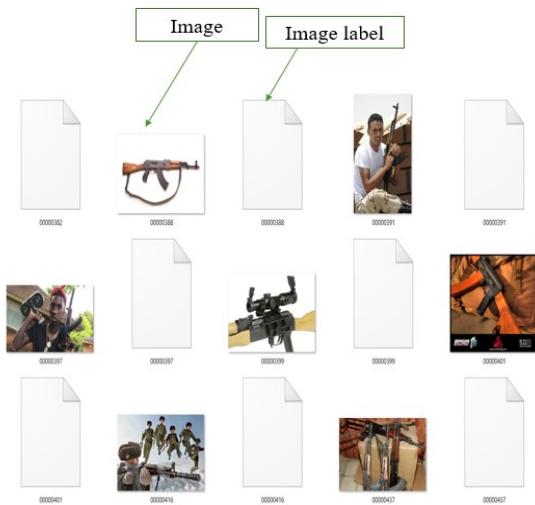

Fig.6. Image along with its label

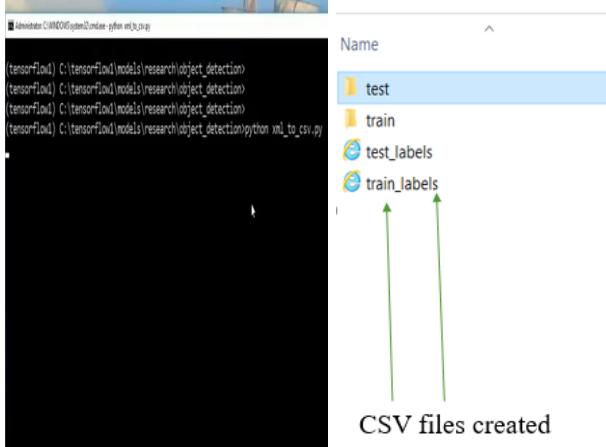

Fig.7. Command to create CSV files for the image labels

XML data is converted into CSV file by executing this command in Anaconda Prompt: python xml\_to\_csv.py as shown in figure 7.

```

Fig.10.Training of Faster R-CNN

#### Pseudo code of faster RCNN

```
Initialize the parameters
confidenceThreshold -> 0.5 #Confidence threshold for bounding box predictions
maskThreshold -> 0.3 # Mask threshold for binary masks
Load the models
weightsPath -> ../../frozen_inference_graph.pb #pre-trained weights
configPath -> ../../rcnn_inception_v2_coco_pets.pbtxt #text graph file to load model onto OpenCV

Initialize the video stream
vs -> cv2.VideoCapture('../../weapon_video.mov') #loading the video

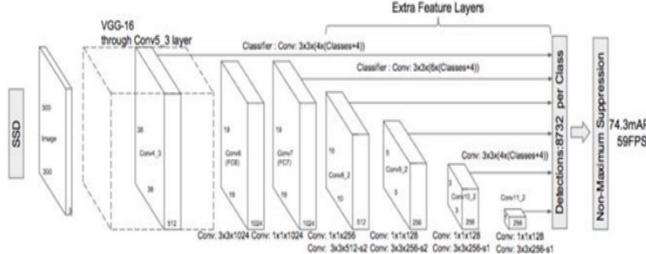

Process each frame
grabbed, frame -> vs.read() #reading each frame and returning the coordinates of the frames
blob -> cv2.dnn.blobFromImage(frame) #creation of 4D blob from a frame
net.setInput(blob) #passing the blob as an input to the ConvNets

Extract the bounding box and drawing the box for each detected object
for i in range(numDetections):
    box -> boxes [0, 0, i]
    mask -> masks[i]
        left -> int (frameW * box [3]) #Acquiring bounding boxes
        top -> int (frameH * box [4])
        right -> int (frameW * box [5])
        bottom -> int (frameH * box [6])
cv2.rectangle(frame, (startX, startY), (endX, endY), colour, 2) #drawing bounding boxes
```

Fig.11. Pseudocode of faster RCNN

### E. SSD (Single Shot Detector)

SSD algorithm reached new milestones in terms of precision and performance detection. SSD speeds up the process by eliminating the need of region proposal network. To overcome the drop in accuracy SSD brings a few technology including default boxes and multi-scale features. These improvements allow SSD to match the Faster R-CNN's accuracy using lower resolution images, which further pushes speed higher. Average scoring is around 74% MAP and 59 fps on COCO dataset. Figure 12 shows SSD VGG-16 Architecture [1] [5] [10].

Architecture of Single Shot MultiBox detector (input is 300x300x3)

Fig.12. SSD VGG-16 Architecture [10]

### Training of SSD

Fig.13. Manually labelled images

Figure 13 shows manually labelled images in XML format. Total 838 considered for training and 241 images for testing (22% testing and 78% training). XML data is converted into CSV file by executing this command in Anaconda Prompt:- python xml\_to\_csv.py. Ground truth box and scale is represented by

$$predicted_{center} * variance0 = \frac{real_{center}-prior_{center}}{prior_{hw}}$$

$$\exp (predicted_{hw} * variance1) = \frac{real_{hw}}{prior_{hw}}$$

"variance0" and "variance1" are 0.1 and 0.2 in general.

### Object detection and recognition

- To make sure object is detected, changes are made in the label map and tf\_record file.
- Label map is the file which stores the total number of types of objects that will be detected. AK47 is added in the label map.

- The images are converted into tf\_record format in Tensorflow so that they can be processed in batches. AK47 is added in the tf\_record format.

```
C:\tensorflow\models - Copy\research\object_detection\training\labelmap.pbtxt - Notepad++
File Edit Search View Encoding Language Settings Tools Macro Run Plugins Window ?
change.log pet_label_map.pbtxt labelmap.pbtxt labelmap.pbtxt faster_
1 item {
2   id: 1
3   name: 'ak47'
4 }
5
```

Fig.14.Label map file to record all the names of classes  
 Figure 14 shows label map to identify classes. Image dataset is created and converted into CSV format. It is now ready to train by SSD model by using command as shown in figure 15.

```
(tensorFlow) C:\tensorflow\models\research\object_detection>python train.py --logtostderr --train_dir=training --pipeline_config_path=training/ssd_inception_v2_coco.config
```

Fig.15. Command used to run SSD Model

SSD model trained until to obtain loss training 0.05 as shown in figure16. Corresponding pseudo code of SSD implementation as shown in figure 17.

```

Fig.16. SSD model is trained until loss is reduced to 0.05

### Pseudo code of SSD

Some of the drawbacks of faster RCNN compared to SSD model are training data is unwieldy and too long. SSD algorithm is a faster option, training occurs in more phases. Network is too slow at inference time and cannot provide accurate real time detection due to time spent on region proposals. SSD fills these shortcomings.

```

Initialize the parameters
confThreshold -> 0.5
maskThreshold -> 0.3

Load the models
weightsPath -> .../frozen_inference_graph.pb
configPath -> .../ssd_inception_v2_coco_2018_01_28.pbtxt

Initialize the video stream
vs -> cv2.VideoCapture(.../traffic_video_source.mp4)

Process each frame
grabbed, frame -> vs.read()
blob -> cv2.dnn.blobFromImage(frame) #creation of 4D blob from a frame
net.setInput(blob)

Extract the bounding box and drawing the box for each detected object
for i in range(numDetections):
    box -> boxes [0, 0, i]
    mask -> masks[i]
    left -> int (frameW * box [3])
    top -> int (frameH * box [4])
    right -> int (frameW * box [5])
    bottom -> int (frameH * box [6])
    cv2.rectangle(frame, (startX, startY), (endX, endY), colour, 2)

```

Fig.17. Pseudo code for SSD implementation

### III. RESULTS AND ANALYSIS

#### A. Detection of weapons using SSD algorithm

##### Case 1: Using pre-labelled dataset

Fig.18. Detection of AK47 gun

Figure 18. Shows detection of a gun AK47 using SSD algorithm. Accuracy of detection is 79%. Further accuracy can be increased by increasing more number training samples.

##### Case 2: Using self-created dataset

Fig.19. COLT M1911 Detected with 72% accuracy

Fig.20. Smith & Wesson Model Detected with 67% accuracy

Figure 19 and 20 shows detection of COLT M1911 and Smith & Wesson Model gun with an accuracy of 72% and 67%.

#### B. Detection of weapons using Faster R-CNN

##### Case 1: Using pre-labelled image dataset

Fig.21. Detection of AK47 using Faster R-CNN

Figure 21 shows detection of AK47 gun using faster RCNN with an accuracy of 99% which shows Faster R-CNN provides the superior accuracy.

Fig.22. Detection of AK47 using Faster R-CNN

Figure 22 shows detection of AK47 in hands of army with accuracy of 99% and 81%.

Fig.23. AK47 gun detection from video stream

Figure 23 shows detection of AK47 gun from video stream with an accuracy of 98%.

##### Case 2: Using self-created image dataset

Fig.24. Detection of Colt M1911 gun

Fig.25. Detection of Smith & Wesson Model 10 gun

Figure 24 and 25 shows detection of Colt M1911 gun Smith & Wesson Model 10 gun using Faster R-CNN algorithm with the accuracy of 74% and 91%.

### C. Performance Analysis

#### Faster R-CNN

TABLE I. PERFORMANCE ANALYSIS: FASTER R-CNN ALGORITHM

Gun Type	Average Accuracy	Speed (S)	Gun Detection	Correct Classification
AK-47	94%	1.28	Yes	Yes
Colt M1911	74%	1.63	Yes	Yes
S&W Model 10	91%	1.74	Yes	Yes
UZI Model	88%	1.49	Yes	No
Remington Model	76%	1.89	Yes	No

From Table 1, it shows that highest average accuracy is obtained for pre-labelled dataset (i.e. AK47) and the Colt M1911, Smith & Wesson Model 10, UZI Model, Remington Model obtained accuracy in the range of 76% to 91%. Faster R-CNN achieves an average Accuracy of 84.6% and average speed 1.606s/frame. This concludes that the pre labelled dataset provided better accuracy because it is trained for millions of images in comparison to the self-created dataset.

#### SSD

TABLE II. PERFORMANCE ANALYSIS: SSD ALGORITHM

Gun Type	Average Accuracy	Speed (S)	Gun Detection	Correct Classification
AK-47	80%	0.67	Yes	Yes
Colt M1911	70%	0.89	Yes	Yes
S&W Model 10	66%	0.78	Yes	Yes
UZI Model	81%	0.61	Yes	No
Remington Model	72%	0.73	Yes	No

Table 2 shows performance Analysis for the SSD algorithm. Obtained SSD Average Accuracy is 73.8% and average Speed 0.736 s/frame. Trained model for 5 classes of guns such as AK47, Smith and Wesson Model 10, Colt M1911, UZI Model and Remington model and obtained maximum confidence level for AK47 gun. Used SSD and RCNN Inception V2 models to train the guns. SSD took 12 more hours to train model in comparison with RCNN model but provided lower accuracy. Faster R-CNN achieved 10.8% more average accuracy than SSD algorithm. SSD provides faster speed than Faster R-CNN by 0.7 seconds. Pre-labeled dataset like AK47 gun provides higher accuracy in SSD and Faster R-CNN models, compared to self-created image dataset.

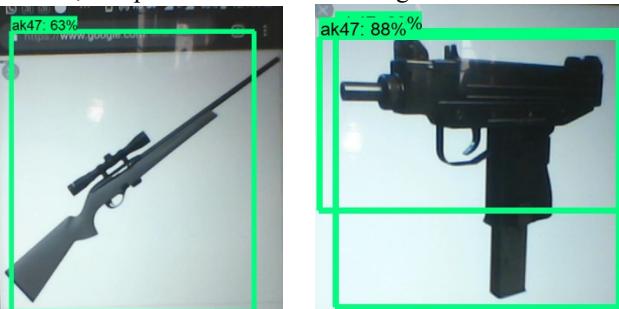

Fig.26 (A) UZI erroneously detected as AK 47 (b) Remington Model erroneously detected as AK47

Figure 26 shows UZI and Remington model gun detection the detection for UZI Model gun and Remington Model gun is successful but the classification is incorrect. These guns are detected as AK47. Further Edge analytics concepts may be applied [13].

## IV. Conclusions

SSD and Faster RCNN algorithms are simulated for pre labeled and self-created image dataset for weapon (gun) detection. Both the algorithms are efficient and give good results but their application in real time is based on a tradeoff between speed and accuracy. In terms of speed, SSD algorithm gives better speed with 0.736 s/frame. Whereas Faster RCNN gives speed 1.606s/frame, which is poor compared to SSD. With respect to accuracy, Faster RCNN gives better accuracy of 84.6%. Whereas SSD gives an accuracy of 73.8%, which is poor compared to faster RCNN. SSD provided real time detection due to faster speed but Faster RCNN provided superior accuracy. Further, it can be implemented for larger datasets by training using GPUs and high-end DSP and FPGA kits [16] [17].
